

Hussien Elmi

Senior Flutter Developer

Email: hussien.elmi@outlook.com | **Phone:** +82 10-9935-7269 (WhatsApp) | **Portfolio:** hussien4321.github.io
Right to Work: UK Citizen | **Location:** Seoul (relocating to the UK)
Available for contract roles (1 month's notice)

PROFILE

Senior Flutter developer with **8+ years of commercial experience** building production apps across healthcare, fintech, food delivery and the public sector. I've worked across several mobile frameworks and **specialise in Flutter**, which I've used extensively in both professional and personal projects, publishing apps to the App Store and Google Play in both contexts.

I structure apps around **Clean Architecture**, with clear separation between UI, business logic and data layers, so codebases stay testable, maintainable and easy to scale over the long term. Beyond feature work, I set up the delivery foundations that keep a project healthy: **CI/CD pipelines, environment-specific builds, and analytics and crash reporting**, so teams can release with confidence and base decisions on real user data.

Additionally, **building and releasing my own apps** outside of work has taught me to look beyond development: planning features, prioritising work and shaping a product roadmap, always asking **why a change is needed, not just how to build it**. It's a perspective I bring to my professional work too, having recently led a team, conducted sprint planning and explained technical trade-offs to non-technical stakeholders.

SKILLS

Flutter & Dart: BLoC, Riverpod, Provider, RxDart, freezed, json_serializable, Dio, slang (i18n)

Architecture: Clean Architecture, SOLID, MVVM, multi-flavor build configuration

Android: Kotlin, Java, Jetpack Compose, Hilt, Room, Retrofit

Backend & Data: Firebase (Auth, Firestore, Functions, Storage, FCM, Remote Config, Crashlytics, Analytics), SQLite, SQL

Testing: Unit and widget testing, Mockito

CI/CD & Tooling: Codemagic, GitHub Actions, Git, Jira, Claude Code

Analytics: Google Analytics, Mixpanel, Optimizely

Languages: English (native), Korean (TOPIK Level 6, professional fluency)

WORK EXPERIENCE

EverEx, Seoul — *Flutter Mobile Developer*

SEP 2024 – PRESENT

AI-driven digital healthcare company. I worked on **Korea's first prescription therapy app** for muscle and joint conditions (MORA Cure) and a Remote Therapeutic Monitoring platform for **physical therapy clinics in the US**.

Development

- Delivered MORA Cure RCR, a regulated medical-device app, from greenfield to store release in two months, designing its Clean Architecture project structure. It shipped ahead of deadline with no major issues, keeping clinical trials on schedule.
- Implemented security controls to meet the strict requirements for regulated medical software, including multi-device login detection, forced logout and app integrity checks.
- Built guided range-of-motion tests on the company's in-house AI pose-detection model, writing the rules that turn real-time joint positions into posture recognition and failure detection, with live feedback to the user.
- Built a two-way Flutter↔WebView JavaScript bridge, enabling a web-hosted therapy module to exchange events with the app and deliver a native-like experience.
- Set up CI/CD with Codemagic for on-demand QA builds and automated releases to the App Store and Google Play.
- Configured dev/QA/prod flavors with secured environment variables, so test features and credentials could not reach production.
- Built an internal admin mode that lets testers jump straight to any screen, significantly shortening QA and debugging cycles.

- Integrated analytics and crash reporting to measure the impact of changes and surface user pain points before they were reported.

Leadership

- Acted as interim lead of the Korea-based team building the US product: ran sprints, allocated work and shaped the roadmap, working in Korean while coordinating with the US team.
- Became the go-to person for all product queries, having worked closely with every stakeholder. Reviewed all feature requirements and suggested changes in line with the product's overall direction.
- Introduced Jira processes and conventions that made sprint progress visible and bottlenecks faster to spot, ensuring the team met its sprint targets on time.

GoHenry, London (Remote) — *Flutter Mobile Developer*

FEB 2022 – FEB 2024

The UK's leading financial education app for children and teens, with **1M+ users**.

- Built key features including investment education, adding enough value to the product to support the launch of a new subscription tier.
- Developed an accessible UI system that adapts to a wide range of screen and font sizes, to support users of all ages.
- Shipped new features every two-week release cycle without compromising the stability of the live production app.
- Worked with backend engineers to shape new API endpoints, removing unnecessary data and combining calls.
- Partnered with PMs and designers from ideation onwards, estimating timelines, assessing feasibility and proposing ways to reduce build time.
- Carried out regular code reviews to keep the codebase consistent and readable, and documented key learnings from my work so knowledge was shared across the team rather than held by one person.
- Worked fully remotely with teams across the UK and US, managing my own workload across time zones and taking full ownership of delivery.

Slice, Belfast — *Android Developer*

MAR 2019 – JAN 2021

US food delivery platform. For about a year I was the **sole developer on SliceOS**, the app used by over half of Slice's partner restaurants (**~10,000 shops**) to receive orders and run their stores.

- Reduced the crash rate by over 80% by quantifying bug impact and prioritising fixes alongside feature work.
- Automated more than 50% of customer support requests through in-app self-service tools, significantly reducing the load on the support team.
- Built restaurant operations features including sold-out menu management, business hours and in-app marketing messages, giving owners direct control of their store without needing to contact support.
- Built a push-notification-driven in-app messaging system with behaviour tailored to each message type, allowing the business to reach restaurants instantly with targeted updates.
- Used analytics to measure feature impact and make the case for future work.
- Contributed directly to backend repositories when backend capacity was limited, so feature work kept moving.

Deloitte Digital, Belfast — *Software Consultant*

SEP 2016 – MAR 2019

Worked on the **UK Home Office's online visa application platform**, used by applicants worldwide.

- Built reusable front-end components to strict government UI/UX standards, keeping the service visually consistent across every page.
- Paired every feature with unit and end-to-end tests, ensuring edge cases in the logic were caught before release.
- Worked with business analysts to turn client requirements into working features, meeting strict government deadlines.

EDUCATION

University of Birmingham — *BSc Computer Science (2:1)* SEP 2013 – JUN 2016
